EXTERNAL
BLACK-BOX
ASSESSMENT

QUALITY LENS

If I record a run or walk, I need to be able to trust the saved workout. When the numbers stop matching the activity that actually happened, the product should either catch it, flag the uncertainty, or give me a practical way to fix it.

Evidence at a glance

TEST / CONDITION	SAVED RESULT / OBSERVATION	EVIDENCE VALUE
GC-01 Walk; iPhone-started and carried	0.91 mi 18:25 20:07/mi HR 125 cadence 94 +80 ft	Gold Camp Road comparison; two tunnel passages.
GC-02 Walk; Watch-started; phone at Captain Jack's	1.00 mi 20:15 20:18/mi HR 124 cadence 92 +75 ft	Changed acquisition path; two tunnel passages.
GC-03 Walk; Watch-started; phone off at base	1.07 mi 21:34 20:05/mi HR 124 cadence 94 +82 ft	Removed paired-phone availability; two tunnel passages.
Saturday Walmart / Artem Run left active during known driving	5.64 mi 1:18:12 13:51/mi HR 85 cadence 82 split 2:02/mi	Independent real-world occurrence; road-following route and vehicle-scale pace.
Sunday Walmart Run; Auto-Pause ON; driving/stops/shopping	5.25 mi 29:21 5:35/mi HR 100 cadence 94 splits 2:16, 2:20, 2:19/mi	Targeted follow-up. Paused states were observed, yet vehicle movement entered the saved record.

OBSERVED

- Two Run records containing known vehicle travel saved vehicle-scale splits and plausible road routes.
- Sunday's 2:16 split reported HR 84 and cadence 98; the combined metrics do not describe a credible human run.
- Six Gold Camp tunnel passages produced noisy instantaneous traces but three plausible saved walks.
- GC distances varied, but durations also varied; the evidence does not establish a distance defect.

SUPPORTED INTERPRETATION

- The primary user-trust risk is acceptance of activity-inconsistent movement into authoritative-looking workout metrics without an observed data-quality signal.
- The controlled tunnel series does not support the original broad theory that tunnel exposure alone explains the severe Walmart symptom.
- This black-box assessment identifies a credible risk; it does not claim to know the product's fleet-wide biggest issues or internal root cause.
- Cross-sensor checks are a design opportunity, not a claimed existing requirement.

PROVISIONAL RISK

Major / P2 candidate, pending product data. Core records can become materially misleading, affecting history and downstream analytics. It is not a crash, data loss, or direct safety failure; occurrence frequency, edit/recovery options, and downstream propagation were not established.

AI ASSISTANCE

AI accelerated research, test-design iteration, and evidence analysis. Field execution, observation capture, evidence review, and final conclusions remained human-owned.
